# Main Programs

- Savanna Monitoring & Evaluation Reporting Framework (SMERF)
  - Savanna wide
  - High-Resolution, Fire Community-based Assessments
- Ecological Thresholds Analysis
  - High Resolution Habitat Mapping
  - High Resolution Fire Mapping
  - GIS Analysis and Reporting
- Emissions Analysis (Smoke over Darwin)
  - High Resolution fuels mapping (including Gamba)
  - CSIRO/BoM Ventilation Index Forecasting tool
  - Sensor Array

Table 2. Observed responses vs. performance threshold criteria.

Response variable	Performance threshold	Observed response	
		2015†	2006–2015
<i>1. Severe fire impacting monsoon rain forest boundary</i>			
1.1 Lowland monsoon rain forest	<10% should be affected by one severe fire in 5 yr	57%	Consistently >40%
1.2 Upland monsoon rain forest	<10% should be affected by one severe fire in 5 yr	40%	Consistently >15%
<i>2. Severe fire affecting fire-prone woodland habitat</i>			
2.1 Lowland woodland	<10% should be affected by two or more severe fires in 5 yr	37%	Consistently >20%
2.2 Upland woodland	<10% should be affected by two or more severe fires in 5 yr	24%	Consistently >10%
<i>3. Frequent fire affecting fire interval-sensitive sandstone heath</i>			
	<10% should be affected by more than one fire in five years	75%	Consistently >40%
<i>4. Long-unburnt habitat for fire-vulnerable small mammals and birds</i>			
4.1 Floodplain	At least 25% should remain unburnt for 3 yr	Achieved 41%	Achieved: consistently >40%
	At least 5% should remain unburnt for 10 yr	Achieved 15%	Achieved: consistently ≥15%
4.2 Lowland woodland	At least 25% should remain unburnt for 3 yr	6%	Consistently <25%
	At least 5% should remain unburnt for 10 yr	1%	Consistently <5%
4.3 Upland woodland	At least 40% should remain unburnt for 3 yr	23%	Achieved for 6 yr
	At least 10% should remain unburnt for 10 yr	7%	Consistently <10%
<i>5. Small fire sizes for fauna with restricted home ranges, and narrowly dispersed obligate seeder plants</i>			
5.1 Floodplain	<10% should be burnt by fires >1 km <sup>2</sup> in extent within a 5-yr period	67%	Consistently >50%
5.2 Lowlands	<10% should be burnt by fires >1 km <sup>2</sup> in extent within a 5-yr period	98%	Consistently >95%
5.3 Uplands	<10% should be burnt by fires >1 km <sup>2</sup> in extent within a 5-yr period	87%	Consistently >65%

† At end of 5-yr assessment period.

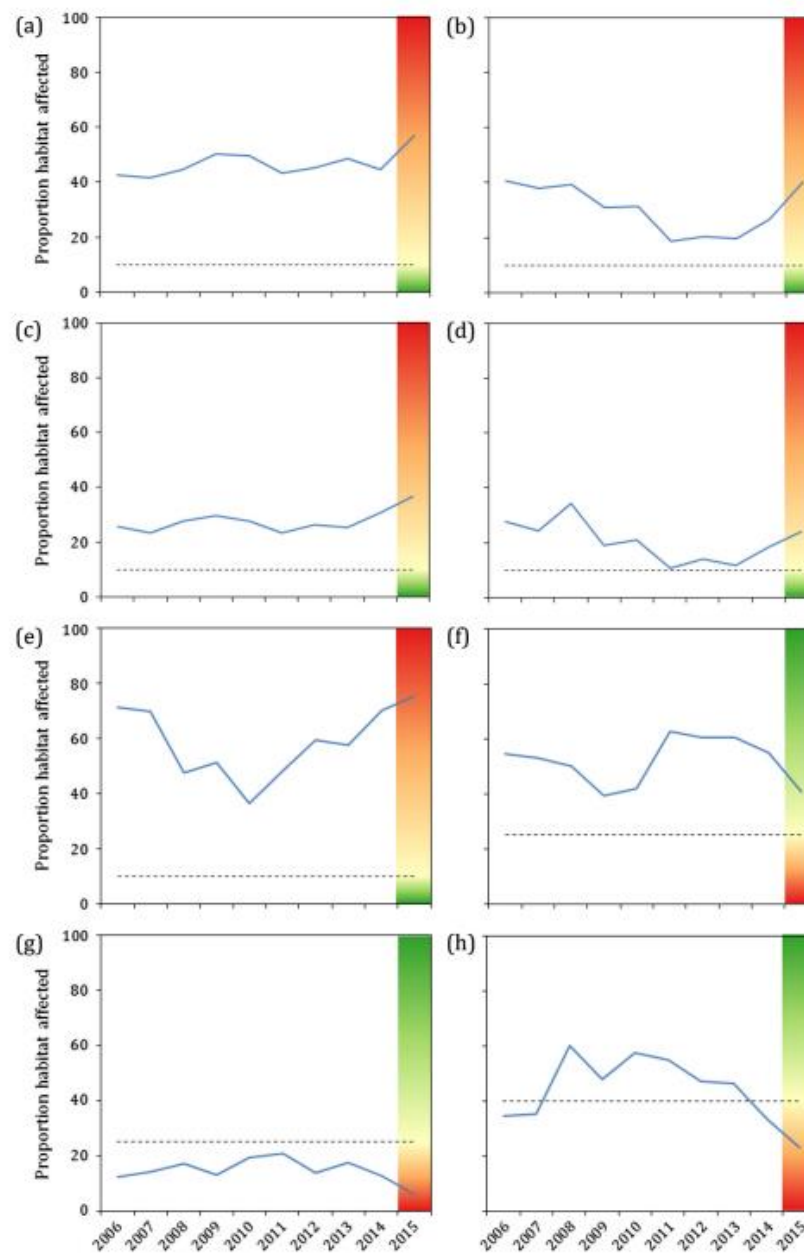

Fig. 3. Ten-year trends for respective ecological performance threshold metrics, for (a) severe fires affecting lowland monsoon rain forest, (b) severe fires affecting upland monsoon rain forest, (c) severe fires affecting lowland woodland, (d) severe fires affecting upland woodland, (e) frequent fires affecting sandstone heath, (f) floodplain habitat unburnt for at least 3 yr, (g) lowland woodland unburnt for at least 3 yr, (h) upland woodland unburnt for at least 3 yr,

# Fire and smoke impacts in northern Australia

RIEL

Research Institute for  
the Environment and  
Livelihoods

# Problem

Bushfire smoke emissions are increasing in the Darwin Region with an impact on human health

August 5, 2013 (Source: <https://earthobservatory.nasa.gov/>)

# Impacts of smoke on health

Bushfire smoke pollution, and especially PM<sub>2.5</sub>, has been associated with a wide range of health effects:

- exacerbations of respiratory symptoms
- declines in lung function
- asthma attacks
- emergency department presentations
- hospital admissions
- premature mortality

# Background

Darwin has the highest mean PM<sub>2.5</sub> concentrations

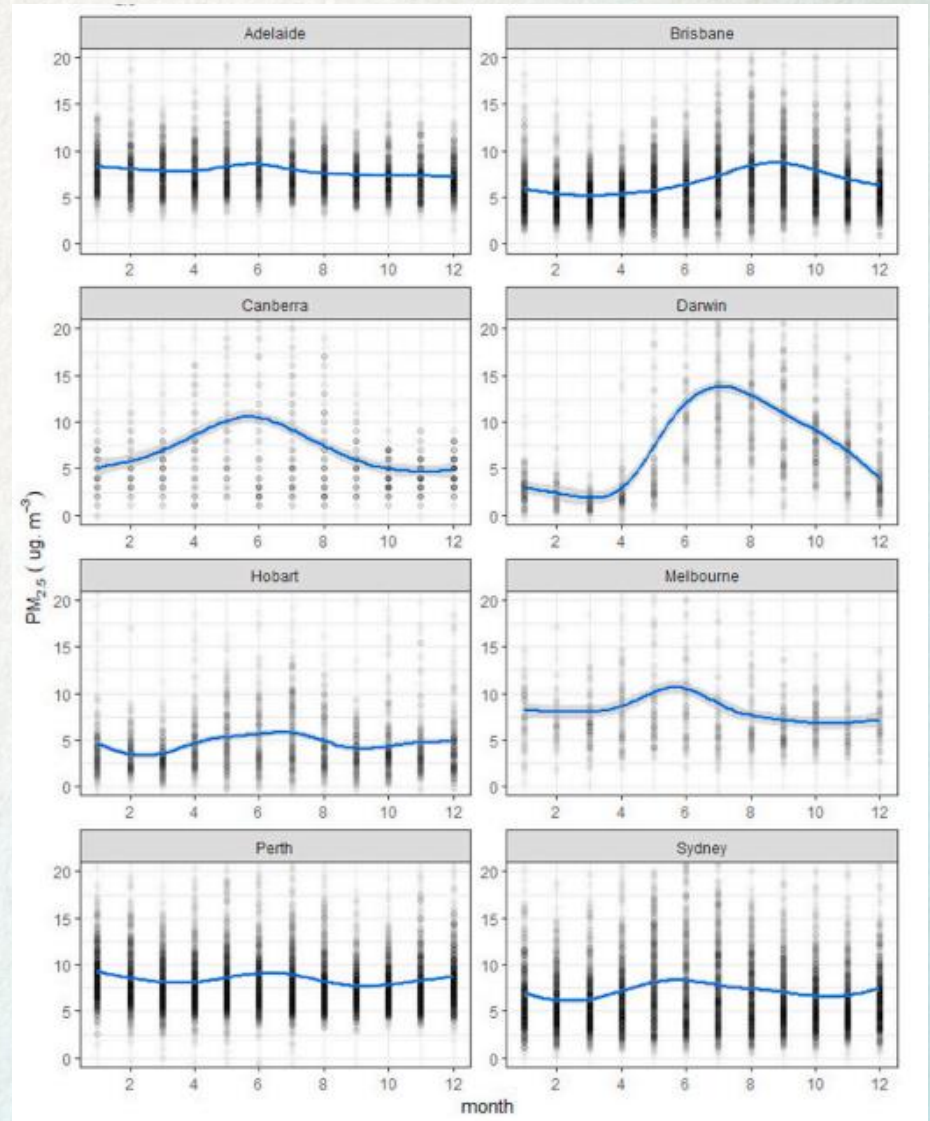

Boxplot for the daily PM<sub>2.5</sub> concentrations in Australia (de Jesus et al. 2020)

- Daily average NEPM and WHO
- Annual average NEPM
- Annual average WHO

PM<sub>2.5</sub> concentrations start increasing in April and peak in July

Seasonal trends of PM<sub>2.5</sub> (de Jesus et al. 2020)

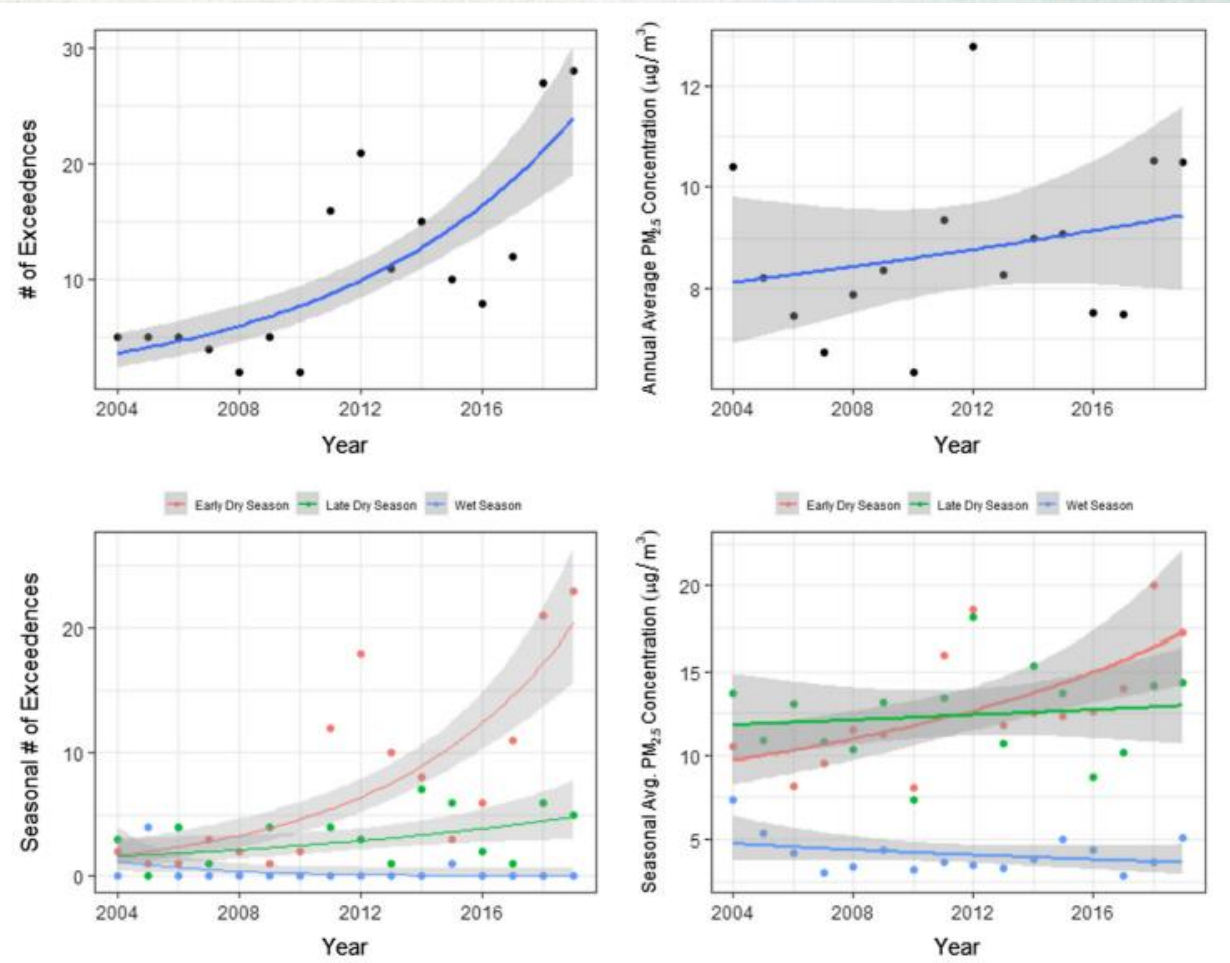

RIEL

Research Institute for the Environment and Livelihoods

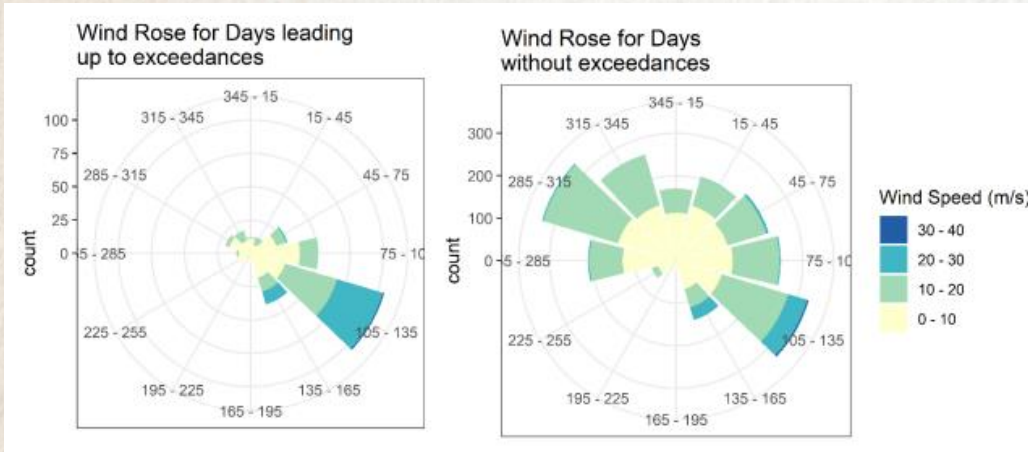

## Smoke pollution is increasing in Darwin in the EDS

Annual number of PM<sub>2.5</sub> exceedances and annual average PM<sub>2.5</sub> concentrations (Jones et al. 2022)

Increase in smoke pollution is related to an increased in EDS burning in carbon abatement project areas in southeast of Darwin (Jones et al. 2022)

Wind speed and direction on exceedance days vs non-exceedance days (Jones et al. 2022)

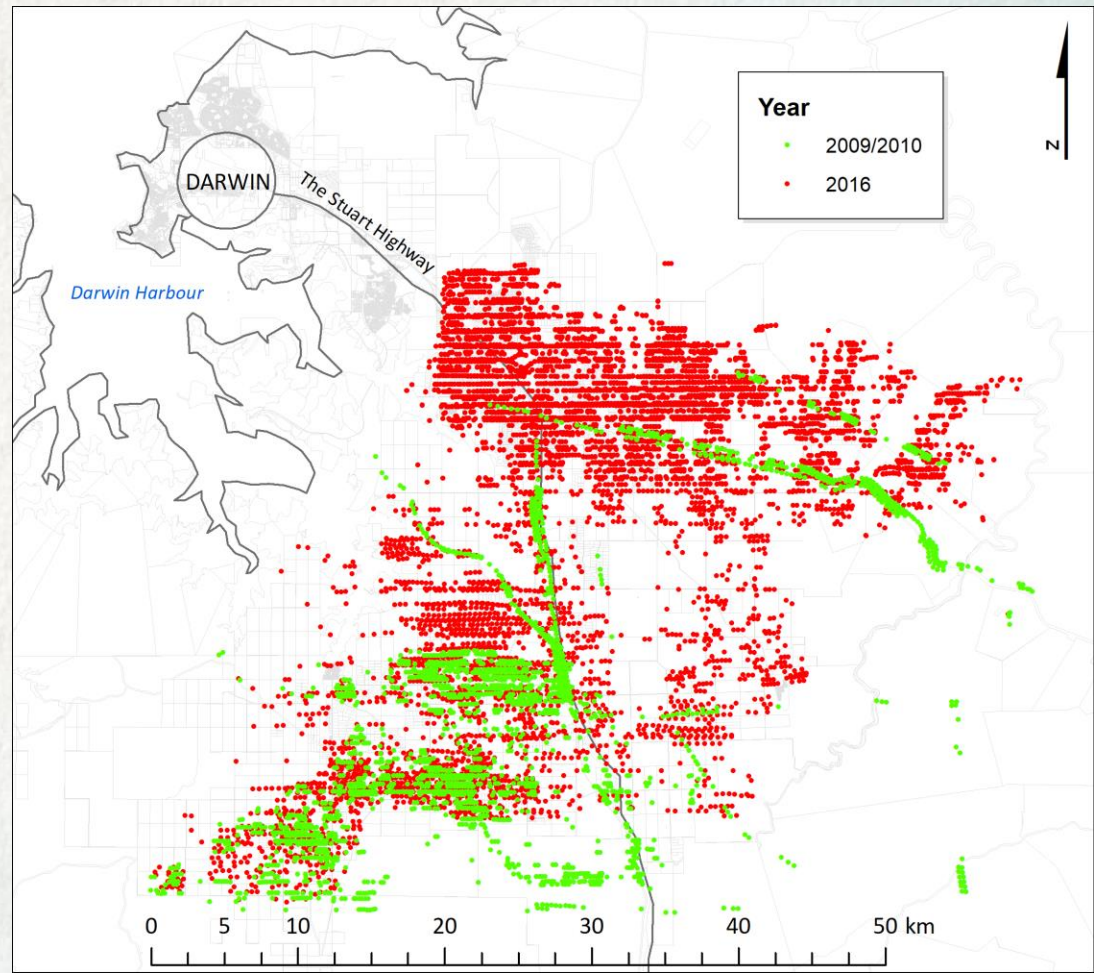

RIEL

Research Institute for  
the Environment and  
Livelihoods

# Background

## Fuels Project Aims

- Collaboration of CDU, NTG (Health Environment, Bushfires NT, NTFRS), CSIRO, Territory NRM.
  
- Develop a detailed fuels map
  - including remnant native vegetation, Gamba, Humidicola, Mission Grass etc
  
- Create a fuels mapping methodology to annually re-create the fuels map
  - to hand over to NTG

## Other Aims

- Use Territory NRM networks and communication skills to develop a community-based program to reduce arson, with a focus on public health.
- Expand sensor network to ascertain the extent of the smoke problem
- Work with public health experts to characterise the location of people presenting with cardio-respiratory illness.
